

Guest Access – “The Way It Should Be”

What business today does not have to support their visitors’ need to have Internet access?

Whether your visitors are contractors, auditors, consultants or sales staff there is an ever-increasing demand for these temporary guests to have Internet access in order to perform their jobs.

How is it done today in many businesses?

- Call IT and ask them to drop everything to create temporary access.
- Let them just plug into the network because it is too hard or can’t wait for IT.
- Write down and give the guest a visitor account or wireless key that never gets changed.

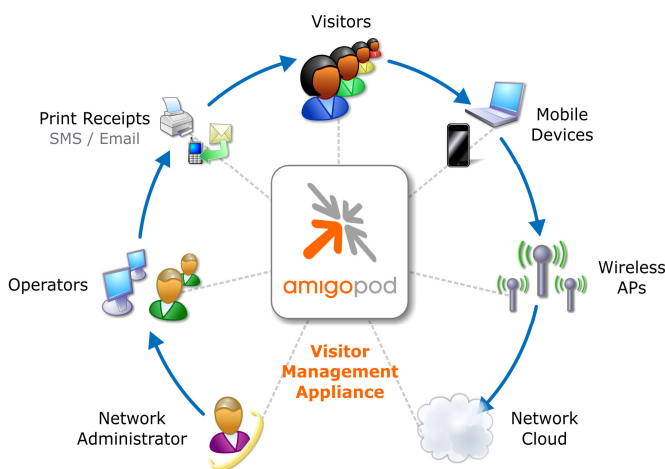

What a disaster waiting to happen! The potential for a visitor’s device plugged into the network to unleash a virus or Trojan is **a real possibility**.

Visitor accounts or wireless keys that are never changed exposes the business to the visitor returning and using the Internet or accessing IT resources long after they have officially left the building.

Why should valuable IT resources be involved in the mundane and transactional process of provisioning guest access?

The amigopod Visitor Management Solution

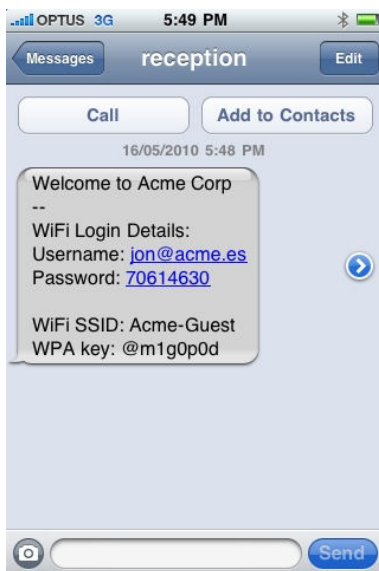

amigopod provides an answer to these challenges with its range of **Visitor Management Solutions**.

Through an easy to use, corporate branded web interface, a receptionist (or any other authorized staff member) can simply fill out a basic form to collect details about the guest and then create a temporary account with the click of a button.

An SMS can be sent to the visitor’s phone welcoming them to the company and providing their login details. Alternatively, a customized printed guest access receipt could be made available at reception.

Wireless is a great choice for delivering guest access, providing coverage in common areas such as foyers and meeting rooms as well as general office space. Wireless guest traffic can be separated from the corporate network and delivered directly onto the Internet, removing the threat of viruses or Trojans impacting the business.

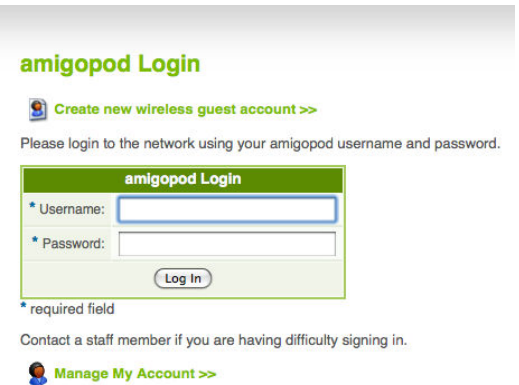

amigopod also supports a completely branded user experience for the guest as well. Using the guest's web browser they will be redirected to the branded splash page or captive portal where they simply enter their credentials received via SMS or printed guest receipt.

The guest's access to the Internet will be terminated based on the account created by your staff, and an audit trail of their login time and traffic volume will be recorded.

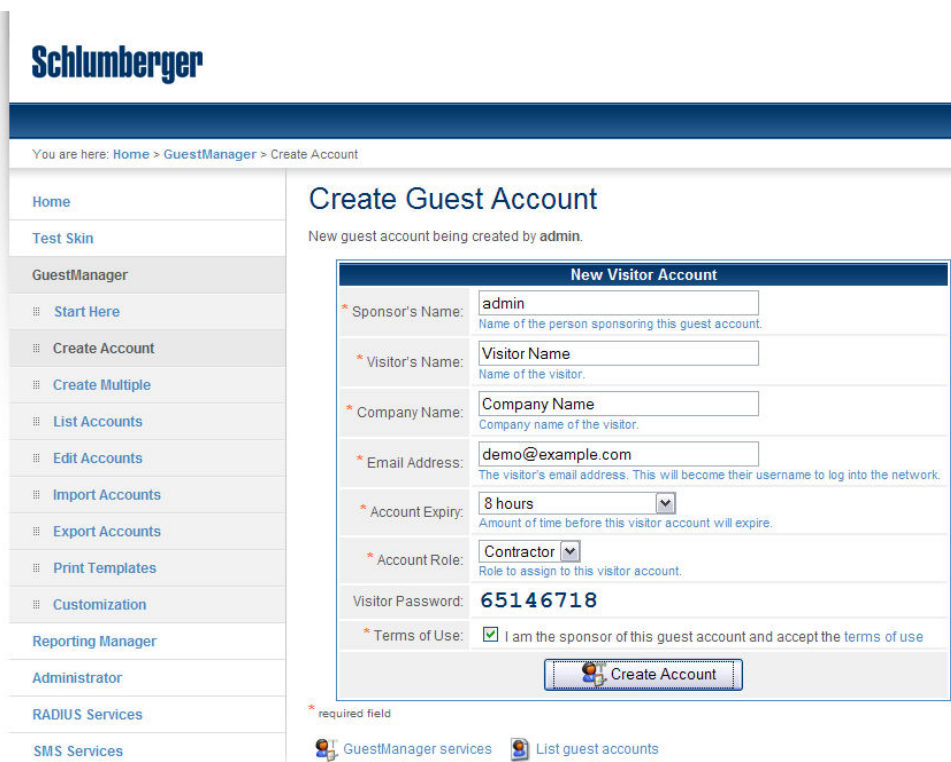

No IT involvement is required for the day-to-day provisioning of guest access. During the deployment of the amigopod solution, IT staff will define the

security policy corresponding to each class of visitor to your network. For example, a general visitor may only get basic Internet access, whereas a contractor may get VPN access and workgroup printing.

amigopod allows your business to provide secure guest access – without burdening your IT resources – whilst reinforcing your company's brand and professionalism.
